FOOTING & TIE-BEAM

ibsa's standard formwork panels can be seamlessly adapted for use as footing moulds. In these applications, the panel height corresponds to the footing's length and width, while the panel width aligns with the footing height. This configuration ensures a precise and efficient fit, enabling the construction of robust, dimensionally accurate footings.

For tie-beams, the system utilises multiple panel heights to accommodate the various joints and branches effectively. ibsa's versatile design allows the integration of different panel sizes, ensuring consistent alignment and seamless connectivity across all sections of the tie-beam structure.

By combining flexibility, precision, and long-term durability, ibsa's formwork system provides a dependable solution for both footing and tie-beam applications, meeting the highest standards of modern construction.
